Job Details

Job ID: fc03d438-1d26-4f86-8709-78421ee5686f
Region: Karnataka
Status: COMPLETED
Request Type: predict
File Count: 1
Created At: 25/4/2026, 4:40:25 am

Analysis Summary

Rice Type: BD39
Total Grains: 12
Healthy Grains: 9
Unhealthy Grains: 3
Health Score: 75%
Quality Grade: Rice Processing Industry (milling/parboiling)
Market Price: 120,010 / 1000 kg
Shelf Life: 24 days (process within weeks — ICAR-NRRI high-risk grade)
Supply Chain: Rice Processing Industry (milling/parboiling)
Health Breakdown:
• broken high: 1 grains (8%)
• discoloured high: 2 grains (17%)
• insect infected: 1 grains (8%)
• unhulled: 8 grains (67%)

Quality Charts

Health Score

Healthy (75%) — 75%
Unhealthy (25%) — 25%

Grain Health

Healthy 75% — 75%
Unhealthy 25% — 25%

Health Distribution

broken high (8%) — 8%
discoloured high (17%) — 17%
insect infected (8%) — 8%
unhulled (67%) — 67%

AI Storage & Handling Advice (LangChain / Ollama)

Based on the provided data, here are the requested assessments:

1. Quality Assessment:

This batch has an overall health percentage of 75%. The health distribution breakdown reveals that out of the total 12 grains detected, 8 (67%) are unhulled, indicating a lack of processing or packaging. Additionally, there are 2 grains (17%) with discoloration and 1 grain (8%) infected by insects. Only 1 grain (8%) is classified as broken high. This mix of defects suggests that the batch may not be suitable for human consumption due to potential contamination risks.

2. Supply Chain:

The recommended supply chain for this batch is "Rice Processing Industry (milling/parboiling)" based on its exact health percentage of 75%. The presence of unhulled, discoloured high, and insect-infected grains suggests that the rice may not meet food safety standards for direct human consumption. Milling or parboiling can help address these issues.

3. Shelf Life:

The estimated shelf life is 24 days (process within weeks), considering the high-risk grade defect types found. The presence of insects and unhulled grains increases the risk of contamination, which may affect the rice's shelf life if not properly processed and stored.

4. Market Price Justification:

This batch fetches Rs.20.01/kg in Karnataka due to its

relatively good quality compared to other batches with similar defects. The 75% health percentage is still acceptable for processing into various products or animal feed, justifying the market price.

5. Storage Instructions:

To ensure the safe storage of this batch:

- * Store unhulled grains in airtight containers to prevent moisture and insect contamination.
- * Handle discoloured high grains with care to avoid further damage or contamination.
- * Keep insect-infected grains in a separate area to minimize cross-contamination.

6. Farmer Summary:

For this Karnataka-based BD39 rice, 9 out of the total 12 grains are healthy, while 3 are defective due to unhulling, discoloration, and insects. This batch is suitable for processing into various products or animal feed, which justifies its market price. Farmers should take care when storing this batch to minimize further damage or contamination.

Please note that all assessments are based on the provided data and may not reflect the actual quality of the rice if processed or stored differently.

IoT Sensor Data

Location: Karnataka
Grain Count: 12
Healthy %: 75%
Dominant Type: BD39

Avg Type Confidence: 99.8%
Avg Health Confidence: 57.3%
